

Systematic Cleaning: Profix® 4-Colours-Wipes

16. August 2017

Clean like a pro with our soft and robust Profix® 4-Colours-Wipes for optimal results in matter of hygiene in different fields of application. The colour coding system avoids germs to be transmitted from one object to another one. The following colours are easy to distinguish and are established in the professional cleaning sector. Blue for general surfaces (for example bed, bedside tables etc.), red for intensive sanitation (for example toilets), yellow for sanitation (mirrors, sinks etc.) and green for kitchens and cafeterias. This system prevents from using accidentally the same wipe, which was used before for example for cleaning a toilet, to clean a working surface.

Our colour-coded cleaning –and polishing wipes are universally applicable and are able to reduce massively the risk for germs to spread in sensitive areas like main kitchens and canteens, hospitals or nursing homes, as well as in hotels, food industry and public administration. The colour system itself, however, does not avoid the germ transmission from one single object, or surface, to another, such as toilets. For impeccable cleaning results, we recommend using the 4-Colours-System in combination with the so-called “wipe-changing method”.

For the Profix® 4-Colours-Wipes our assortment offers suitable and space-saving dispenser. Practical and stylish, the dispensers can be placed on the floor with non-slip rubber pads, or else mounted directly on the wall.
